Satya Sourav Patel | DevOps Engineer

+91-8456927432 | satyasouravssp0@gmail.com | linkedin.com/in/satyasouravpatel | github.com/imssp

Professional Summary

Cloud-native DevOps Engineer with 3+ years of combined enterprise and independent experience architecting highly available Banking and Telecom AWS infrastructures and managing container orchestration(Kubernetes, Docker, Helm). Proven success accelerating release cycles through automated CI/CD, GitOps workflows (Argo CD, GitHub Actions), and robust Terraform IaC. Skilled in Python automation, DevSecOps integrations, and system observability.

Skills

Cloud & Orchestration: AWS (EKS, EC2, S3, VPC, IAM, Lambda, ECR, ALB, Secrets Manager) | Kubernetes, Docker
CI/CD & GitOps: GitHub Actions, GitLab CI, Jenkins, Argo CD| **Infrastructure as Code & Configuration**: Terraform, Ansible, Helm
DevSecOps & Security: Trivy, SonarQube | Kubernetes RBAC, Network Policies| **Languages & Scripting**: Python, Bash, YAML
Observability & Service Mesh: Prometheus, Grafana, CloudWatch, Istio| **Databases & Caching**: PostgreSQL, MySQL, Redis

Experience

Independent DevOps Engineering | **Self-Directed** *Jan 2024 – Present*

- Architected a GitOps workflow for a Python web application maintaining source code and Kubernetes manifests in two repositories. Implemented a GitHub Actions CI and Argo CD to detect new image tags and sync the cluster state with rolling updates.
- Designed a Kubernetes environment having isolated team namespaces to explore shift-left security. Integrated Trivy within GitHub Actions to detect image vulnerabilities. Applied RBAC manifests and Network Policies for cluster hardening and multi-tenancy.
- Built a dedicated observability and routing lab by deploying an Istio service mesh into a test cluster having pods with envoy proxies using kubernetes manifests to execute canary releases. Used Prometheus operator to scrape metrics and Grafana to visualize cluster health and golden signals.

Tata Consultancy Services, Kolkata *Jul 2021 – Dec 2023*

DevOps Engineer | Project: BANCS (Clients: Aditya Birla, ICICI Health Insurance, Future Generali)

- Deployed 6 multi-tenant Amazon EKS clusters to host 47 containerized banking and insurance microservices using Terraform and managed them using reusable Helm charts which increased efficiency of release cycles by 35%.
- Created pipelines using GitLab CI/CD to deploy and destroy on-demand, ephemeral environments on a development Kubernetes cluster to enable automated tests, validations and regressions reducing go-live time of features and bug fixes from 3 days to 1 day.
- Managed observability for AWS layer using cloudwatch container insights and for microservices layer by deploying kube-prometheus-stack and using ServiceMonitor CRDs. Maintained Grafana dashboards as code improving remediation and significantly reducing incident MTTR.

Junior DevOps Engineer | Project: Openreach Portal (Client: British Telecom)

- Provisioned a large-traffic telecom application having 12 micro-services which receives 500 to 5,000+ RPS by managing terraform modules for EC2, ALB, IAM and creating Auto Scaling Groups for SIT/UAT and PROD environments ensuring zero downtime.
- Developed ansible playbooks (using YAML) and bash scripts for configuration of EC2 instances and user data, eliminating dependency and version bugs and reducing deployment errors by 25% in the first 3 months.
- Partnered with a 6-person DevOps team to build and manage 17+ CI/CD pipelines using Jenkins and containerized microservices using Docker and stored build images on ECR to ensure on-time and adhoc deployments.

Certifications

- AWS Certified Solutions Architect – Associate Link
- AWS Certified Cloud Practitioner Link
- Docker and Kubernetes: The Complete Guide Link

Projects

End-to-End DevOps CI/CD Platform | *GitHub Actions, Terraform, Kubernetes, ArgoCD, Docker* | GitHub Repo

- Provisioned AWS infrastructure and Kubernetes clusters using Terraform manifests to achieve a cloud-native pipeline.
- Automated Docker builds with GitHub Actions and implemented pull and sync based deployments using Argo CD.

MLOps Pipeline (Diabetes Prediction) | *Docker, Kubernetes, FastAPI, Python* | GitHub Repo

- Built a real-time diabetes prediction machine learning pipeline using Python and FastAPI.
- Containerized the API with Docker and deployed it on Kubernetes to enable scalable inference.

AWS Cost Optimization Automation | *Boto3, AWS Lambda, EBS, CloudWatch* | GitHub Repo

- Engineered a serverless Python and Boto3 tool on AWS Lambda to detect and delete unused EBS snapshots.
- Reduced continuous cloud storage costs by scheduling automated cleanups via CloudWatch Events.

Education

Veer Surendra Sai University of Technology Odisha, India
Bachelor of Technology (Production Engineering) *Aug 2017 – Aug 2021*
